QUICK SELECTION TOOL

• Just click and drag (or draw) around the subject, and Photoshop will use its smart technology to figure out what you are trying to cut out. This does a pretty good job at determining what subject or object you’re trying to select.
• You are highlighting what you want to select so any adjustments you make will only affect the selected area. This is a quick and smart tool. If you are doing more precise editing, you may want to select everything more carefully.

LAYERS

• Layers are the most important feature of Photoshop, and the most unique. We use the Layers panel to create new layers, delete existing layers, rename layers, move layers around, turn layers on and off in the document, add layer masks and layer effects... the list goes on. All of these actions are done from the Layers panel.
